PROFILE

I am a UX/UI and product designer working end to end: research and strategy through information architecture, interaction and interface design, into design systems and shipped product. I have designed multi-sided marketplaces, logistics operations tooling, healthcare and diagnostic platforms, and SaaS dashboards — the kind of products where the hard part is not how a screen looks, but how much complexity you can take away from the person using it.

CORE SKILLS

UX research · Information architecture · User flows · Wireframing · Prototyping · UI design · Design systems · Interaction design · Usability testing · Accessibility (WCAG 2.1 AA) · Product thinking · Content design · Responsive design · AI-assisted design workflows

Industries: Agriculture · Logistics · Healthcare · Branding

EXPERIENCE

Product Designer (UX/UI) · CropVibe

2026 — PRESENT

Lead designer on a multi-sided agricultural marketplace: five commercial roles on one account, across marketplace, rentals, consultancy, courses and an admin console.

- Designed the role-lens architecture that lets one account act as five businesses, making a sixth revenue line an extension rather than a new product
- Rebuilt the consultancy module from an un-bookable catalogue into a three-step booking flow with availability, verified credentials and a persistent record
- Built the token-based design system — 60/30/10 colour, 8px grid, 44px touch targets and contrast-checked pairings — used across seven modules
- Paired directly in the front end on the calendar and booking sheet, where coded prototypes settled decisions static frames could not

Product Designer · Healthcare & diagnostics products

2025 — 2026

End-to-end design on a diagnostics platform and a care-coordination product, both safety-critical and both heavily constrained by clinical review.

- Redesigned the diagnostic result experience from a clinical PDF into a plain-language, clinician-reviewed explanation with safety-tiered next steps
- Replaced undifferentiated red flags with three clinically defined severity tiers, calibrated against both false alarm and false reassurance
- Designed a shared patient view for four clinical roles, replacing a fragmented per-role model
- Delivered a WCAG 2.1 AA pass on the result flow, including screen-reader and 200%-text verification

UX/UI Designer · Logistics operations tooling

2025

Designed an exception-first operations view for dispatchers running live delivery operations from spreadsheets and chat groups.

- Replaced an inventory-first table with a prioritised exception queue, moving triage out of the dispatcher's head and into the product
- Put cause next to fact, removing a median of three window switches per delay investigation
- Made shift handover a by-product of recorded actions rather than a message written from memory
- Contributed a density scale and a colour-independent severity model to the internal design system

Designer — brand & digital · Independent / freelance

2024 — PRESENT

Identity and interface work for founders and small product teams, delivered as tokens and rules rather than logo files.

- Identity systems handed over as design tokens, so the brand survives contact with an engineering roadmap
- Contrast-checked palettes presented as approved pairings, removing the brand-versus-accessibility argument before it starts
- Marks designed from the smallest size up, because favicons are where identities fail
